

A walk down a mountain to a lake on the other side(?) ***St. Albans, Vermont March 2016***

Lake Champlain Water

Road takes a 90 degree drop down – I'm walking.

Driveway off to the side

Mountains silhouette

If it would have the snow this last winter to Spring Season in March 2016, long metal flat boards topped with high topped boots clipped in when a firm placement of a boot stomp hit, a skier's dream in intermediate level drops to and advancement drops of 90 degree straight drops to bottom to a plateau - mountain plateau. The snow was a not constant depth to produce an event this last winter into March 2016. But the angles of the hills still lift you to a height to see something not usual in other parts of the mountain or other geographical places. The walk down a 90 degree drop to stop at a short plateau. The view from a friend's property of a walk down to the plateau; if you could build a bridge from the point where I stood going down the mountain across the valley (shown left) I would walk right to the edge of the mountain water lake in the horizon before the mountains presented itself into a higher mountain viewed above the lake.

Take a walk visually in the pictures shown to the left and walk across a valley to a lake across the sky that shows a silhouette of the Distance Mountains in view. *Visually can you get your feet wet too?*
